⁴ Shanghai Advance Research Institute, CAS, Shanghai, China

⁵ PSI Center for Accelerator Science and Engineering, Villigen, Switzerland

Abstract

Many accelerator-related conference series have adopted the same standards for electronic publication and have joined the Joint Accelerator Conferences Website (JACoW) collaboration for the publication of their proceedings. This document describes the requirements for the submission of papers to these conferences and their ultimate publication at www.JACoW.org. Please consult individual conference information for page limits, method of electronic submission, etc. The abstract itself is to act as a stand-alone entity and, as such, should not include numbered reference citations, references to pictures, nor footnotes. Any acronyms should be expanded on their first occurrence, both in the abstract and in the rest of the paper.

SUBMISSION OF PAPERS

Each author must submit the PDF file and all source files (text, figures, bibliographic references) to ensure the paper can be reliably reconstructed when there are processing difficulties, errors, or mistakes to be corrected.

MANUSCRIPTS

This paper serves as a L^AT_EX style guide for JACoW conferences. It describes the L^AT_EX class file and specialties specific to L^AT_EX. A shorter template exemplifying usage of the requirements is also provided for authors. Please consult www.JACoW.org or the individual conference.

General Layout

The implementation of the layout requirements are realized in the ‘jacow’ class file (v3.00 of 2026-02-02) and demonstrated in a separate template (see `jacow-latex-template.tex`). As all parameters for page size, margin specifications, column layout and balancing are set in the class file, Fig. 1 only illustrates the layout of the text on the page.

The page size option (e. g. ‘a4paper’ or ‘letterpaper’) has no influence on the final size of the generated PDF as it is internally set to be the ‘jacow’ page size (red box in Fig. 1); it can therefore be omitted. Table 1 is provided for checking the measures in Acrobat. It gives the page width and height in points, millimeter, and inch.

Figure 1: Layout of papers using the ‘jacow’ page size (red box) which is the shorter side of A4 (width) and of letter (height) paper.

Table 1: Page Size Measures of jacow Class

Unit	Width	Height
pt	595.0 pt	792.0 pt
mm	210.0 mm	279.5 mm
inch	8.26 inch	11.0 inch

If desired, tables and figures may span the whole 170 mm page width (2 columns with 82.5 mm each plus a gutter of 5 mm) as shown in Fig. 1.

Authors are advised to use T_EX names for specifying the width of embedded material: `\textwidth` is equivalent to 170 mm, `\columnwidth` to 82.5 mm, `\linewidth` is normally equivalent to `\columnwidth` but can be used, e. g., when a table is embedded in a list environment which by itself is indented and does not have the full width of the column.

Fonts

In order to produce portable Adobe Acrobat PDF files, authors are asked to use only the fonts defined in the class file in standard, bold (i. e., `\textbf`) or italic (i. e., `\textit`)

* Work supported by <funding note>

[†] v.r.w.schaa@gsi.de

Figure 2: Example of a full-width figure showing the JACoW Team at their annual meeting in 2025 at CERN in Geneva, Switzerland.

form and symbols from the standard set of fonts. The font format should be TrueType or OpenType.

Authors writing papers containing equations and other mathematical expressions should make sure that the matching math font set is available. The standard setup uses the »TeX-Gyre« fonts which requires the matching math font package »tex-gyre-math«, which is not automatically supplied and may have to be downloaded from the »Comprehensive T_EX Archive Network (CTAN)« [1].

Title and Author List

The title uses bold uppercase letters and is centered on the page. Individual letters must be lowercased to avoid misinterpretation (e. g., mW, GeV, SwissFEL, SPring-8). This is done using the macro `\NoCaseChange{text}`, where the text should include the whole string and not only lowercase letter(s): use `\NoCaseChange{mW}` instead of `\NoCaseChange{m}W` or `\lowercase{m}W` as it will ease searching for specific strings. To include a funding support statement, use `\thanks{<funded by ...>}` after the title. See also the subsection on »Footnotes«. If author list and affiliation do not fit on a line, place the affiliation on a line by its own (in this case the last author is not separated from the affiliation by a comma).

The names of authors and their organizations/affiliations should be grouped either

- *by authors*: the authors are listed in alphabetical order (primary author first) and carry a superscript number to refer to their affiliation (like in this paper).
- *by affiliation*: The name of the submitting or primary author should be first, followed by the co-authors, alphabetically by affiliation.

Additional macros are available for the “by authors” variant, which simplify the assignment of names to affiliations and automatically generate superscripts. The following setup is similar to the one which generated the author and affilia-

tion block on the title page of JACoW Template (see below under section **TEMPLATE**):

```
\author[1]{A. N. Author\thanks{email address}}
\author[1,2]{B. Coauthor}
\author[2,3]{C. Contributor}
\affil[1]{Institute/Affiliation, City, Country}
\affil[2]{Institute/Affiliation, City, Country}
\affil[3]{Institute, City, State, Country}
```

Where grouping is by affiliation, and there are authors with multiple affiliations, then the secondary affiliation is inserted below the author/affiliation listing, commencing with the words ‘also at’, and indicated by a superscript number. See **APPENDIX A** for further clarification and examples.

Affiliation

The affiliation should include the name of the institution or company with which the author is affiliated. Specific departments or sub-organizations should not be included. An acronym may be used. Only the city and country should be listed beside the affiliation name (for some countries, like the US or Canada, the two-letter state abbreviation may be used). Do not include postal addresses, street names, or postal codes. For city-named universities, repeat the name of the city when giving the location (e.g., University of Darmstadt, Darmstadt, Germany).

Title and Section Headings

Title and section headings are automatically uppercased, therefore the author must ensure that all units and acronyms with mixed case writings (keV, MeV, GHz, μ s, SwissFEL, SuperKEKB, FCC-hh) are correctly typeset (see macro `\NoCaseChange{text}` in the last subsection). The plural of proper nouns and acronyms in uppercase has to be a LOWERCASE “s” (e. g., LINACs, PLMs) without apostro-

phe. Numerical plurals also do not use apostrophes (e. g., 1980s).

Please follow the recommendations for good scientific writing for line breaks in title and section headings:

- Do not let a single word stand on a line,
- Try to break lines by meaning or context,
- Do not hyphenate words.

Section headings bold uppercase letters and are centered in the column. All section headings should appear directly above the text—there should never be a column break between a heading and the following paragraph.

Images should not be placed directly after any heading without accompanying text.

Subsection Headings

Subsection headings use italic letters and are left aligned in the column, the heading is set in Title Case (or Initial Caps) and should appear directly above the text—there should never be a column break between a subheading and the following paragraph.

There is a website for the correct implementation of upper/lower case (Title Case) for headings of the second and third level named »Title Case Converter« [2].

Third-level Headings These heading uses bold letters, is indented and runs into the paragraph text. In $\LaTeX$ these headings are created with $\LaTeX$'s `\subsubsection` command. A subsubsection may not appear after a section heading without a previous `\subsection` heading.

Fourth-level Headings These headings uses italic letters, is not indented and runs into the paragraph text. In $\LaTeX$ these headings are created with $\LaTeX$'s `\paragraph{title}` command. A `\paragraph{...}` may not appear after a subsection heading without a previous `\subsubsection`.

Paragraph Text

Paragraph text uses a 10 pt font and is justified. The beginning of each paragraph is indented.

Figures, Tables and Equations

Figures and tables should be placed as close as possible to their place of mention. Lettering in figures and tables must be large enough to reproduce clearly. Use of non-approved fonts in figures can lead to problems when the files are processed. Specifically when using figures in PDF format, make sure that all fonts are embedded in the PDF.

In $\LaTeX$ make sure to use non-bit-mapped versions of Latin Modern fonts in equations (TrueType or OpenType fonts are required).

Each figure and table must be numbered in ascending order (1, 2, 3, etc.) throughout the paper. Figure captions are placed below figures, and table captions are placed above tables.

Figure captions are formatted as demonstrated in Figs. 1 and 2. Table captions are typically composed as a heading, with the initial letters of principal words capitalized and

without a period at the end (see Table 1). Any reference to the contents of the table should be made in the text of the paper rather than from within the table caption itself. In circumstances where it is deemed necessary to assign a sentence to the table caption, as opposed to a heading, the sentence should be written in sentence case. Additionally, a period must be inserted at the end of the caption.

The $\LaTeX$ template and this style guide make use of the 'booktabs' package to format tables. The use of vertical lines to separate columns is strongly discouraged. For the horizontal separation `\toprule`, `\midrule` and `\bottomrule` can be used (a column can be separated using `\cmidrule`). The parameter row is typeset in bold, therefore care must be taken when Greek letters and mathematical expressions are used.

When referring to a figure from within the text, the convention is to use the abbreviated form (e. g., Fig. 1) *unless* the reference is at the start of the sentence, in which case "Figure" is written in full. Reference to a table, however, is never abbreviated (e. g., Table 1). As a matter of style, authors are advised not to begin any sentence with an abbreviation or a number.

Special care has to be taken, when referencing figures, tables, or equations of external references. To avoid confusion, rewrite phrases such as "in Fig. 2 of Ref. [1]" to the standard cross-reference notation "in [1, Fig. 2]". Similarly, rewrite phrases such as "in Eq. (8) of Ref. [1]" to be [1, Eq. (8)].

Displayed equations do not need a number (i. e., it will not be referenced), to suppress the automatic numbering use the command `\nonumber`. Equations with number must not be referenced.

When referencing an equation, use the word "Equation" at the start of a sentence, and the abbreviated form, "Eq.", if in the text. The equation number is placed in parentheses (e. g., Eq. (1)), which can be achieved in $\LaTeX$ using `Eq.~\eqref{eq:label}`.

Equations are considered an integral part of the text and are punctuated accordingly. If a sentence is complete, a period should be placed at the end of the equation, and the following paragraph should be indented, i. e., in $\LaTeX$ an empty line should follow the equation as it is the case for Eq. (1).

The following equation ends the sentence

$$C_B = \frac{q^3}{3\epsilon_0 mc} = 3.54 \mu\text{eV/T}. \quad (1)$$

If the sentence is not completed with the equation, a comma must be placed after the equation. This is particularly the case if the text following the equation begins with words such as »which, with, where, here, ...« (see Eq. (2) as an example). Here the following text is not indented.

The spot size is given by

```
\begin{equation}
\sigma_s = (\sqrt{\epsilon\gamma} L)^2 \ ,
\label{eq:spot_size}
\end{equation}
```

where L represents the distance to the ...

The spot size is given by

$$\sigma_s = (\sqrt{\epsilon\gamma} L)^2, \quad (2)$$

where L represents the distance to the ...

Units

Symbols for units should be printed in Roman (upright) type. This is a requirement by the »International Union of Pure and Applied Chemistry« (IUPAC) [3,4]. They should remain unaltered in the plural, and should not be followed by a full stop except at the end of a sentence.

$r = 10\text{ cm}$, not »cm.« or »cms.«

An unbreakable (thin) space should be placed between value and the unit. The style guide uses the 'siunitx' package to format units, the “\,” is a shorthand for the thinspace in $\LaTeX$. As the old macros '\SI', '\SIlist', '\SIrange', and '\si' are deprecated since version ≥ 3.0 , the following examples all make use of the new syntax '\qty', '\qtylist', '\qtyrange', '\unit', and '\num'. Some examples are:

```
\lambda$ = \qty{5.896e-7}{m} = 589.6\,nm \\\
\qty{3}{keV}, \qty{2.5e3}{kW}, \qty{7}{\um}
```

$\lambda = 5.896 \times 10^{-7}\text{ m} = 589.6\text{ nm}$
 3 keV , $2.5 \times 10^3\text{ kW}$, $7\text{ }\mu\text{m}$

Please be aware that the standard $\LaTeX$ » μ « (μ) is not the correct » μ « character for units as it is an italicized μ and not the required upright one. The easiest way of achieving the correct output is the use of '\qty{<value>}{<unit>}'. The use of $\upmu$ or $\textmu$ is discouraged as the first needs '\usepackage{upgreek}' and math-mode, the second one is in text mode, but requires special attention width) because of the macro and the following unit, e. g. »m«, as shown in the example:

```
\qty{7}{\um} or \qty{7}{\micro\meter} \\\
7\,\textmu\text{m} or \qty{7}{\micro m} \\\
```

$7\text{ }\mu\text{m}$ or $7\text{ }\mu\text{m}$
 $7\text{ }\mu\text{m}$ or $7\text{ }\mu\text{m}$

A number of commands (\approx, \ge, \geq, \gg, \le, \leq, \ll, \sim, \pm, ...) can be used in 'siunitx' commands without switching into math-mode using $\$...\$$. In addition the »~« character is particularly useful, as it is often used accidentally instead of \sim (or \approx) and became a space outside of 'siunitx' commands.

```
distance ~5 m, $\sim$7\,\textmu\text{m},
\qty{~17}{\uA}
```

distance 5 m, $\sim 7\text{ }\mu\text{m}$, $\sim 17\text{ }\mu\text{A}$

Even the per cent sign (%) has to be written using a thinspace. There is no recommendation for using the symbol '\%' or the name “per cent” (\percent) within 'siunitx' [5].

```
\qty{15}{\percent} or 15\,\%
```

15 % or 15 %

When a unit appears in a hyphenated, compound adjective that comes before a noun, it takes on the singular form, e. g., “the 3.8-meter long undulator”.

Numbers

The \num* commands are very powerful to output all kind of expressions, list, products, ranges and more.

```
\num{1e7}, \num{\approx 7e-2} \\\
\num{+-17}, \num{\pm 17}, \num{\l1142}
```

≤ 7 , $\approx 7 \times 10^{-2}$
 ± 17 , ± 17 , $\ll 42$

Expression like » $4.3\$ \times 10\$^{-9} \$$ « can be written much simpler without math-mode as »\num{4.3e9}« with relaxed spacing around “x” or in “squeezed mode”:

```
4.3\$ \times 10\$^{-9} \$ --- \num{4.3e9} ---
\num[tight-spacing = true]{4.3e9}
```

4.3×10^9 — 4.3×10^9 — 4.3×10^9

Specific changes to the defaults of »siunitx« can be made using the preamble command »\sisetup{...}«

```
\sisetup{exponent-mode = engineering,
tight-spacing = true,
...}
```

Element, Isotopes, Compounds, Charge States

The package “mhchem” (not preloaded in jacow.cls) eases the writing of isotopes and charge states without the use of math-mode or lengthy text-mode superscripts and subscripts. In addition the vertical placement of superscripts is optimized.

The following expression becomes much more readable with the use of »\ce{formula}« from “mhchem” package:

```
\textsuperscript{12}C\textsuperscript{4+} ---
\ce{^{12}C^{4+}}
```

$^{12}\text{C}^{4+}$ — $^{12}\text{C}^{4+}$

There is no need to use {...} for superscripts and subscripts terms, and the command works in text mode (even in headings) and in math mode. Subscripts do not need special treatment, a »_« character can be omitted.

```
H\textsubscript{2}O --- \ce{H2O} --- \ce{Sb2O3}
```

H₂O — H₂O — Sb₂O₃

The En Dash (—), Em Dash (---), or Hyphen (-)?

The em dash (—) and en dash (–) are punctuation marks distinct from hyphens, differentiated primarily by function (and length). The em dash (width of ‘M’) signifies a strong break, abrupt change, or adds emphasis, functioning like a comma or colon. The en dash (width of ‘N’) indicates ranges, such as times, dates, or numerical spans, represented by words like “to”, “through”, or “and”. Use it between page numbers, figure citations, academic years, proper nouns, names, a range of values, or for opposites.

Examples: pp. 10–15, 1984–1990, Jones–Smith theorem, 10–20 cm, input–output, voltage–current curve, analog–digital converter. Also, use the en dash in chemical abbreviations such as Ni–Al–Si. When using the en dash to represent a range, if the word “from” occurs, the word “to” must be used rather than an en dash (e.g., ranges from 5 to 50 times).

The em dash is used in ordinary writing to mark a suspension of the sense. It is also used like parentheses, to mark a subordinate thought within a sentence, e.g., *I now need one thing—a long vacation.*

The hyphen (–) is used in line breaks to hyphenate words, to avoid ambiguity (such as ‘re-sign’ vs. ‘resign’), in prefixes and suffixes (generally used with self-, ex-, and all-, or to avoid awkward vowel combinations, e.g., co-worker, preempt, anti-inflammatory), spelled-out compound numbers (e.g., sixty-six), or in compound nouns: like ‘free-for-all’.

Footnotes

Footnotes on the title and author lines may be used for acknowledgements and email addresses. L^AT_EX selects from its repertoire a non-numeric character (*, †, ‡, §, ¶, #, and further on doubling the precious characters: **, ††, ...) to indicate the footnote. The “pseudo footnotes” for funding note and email address should only appear at the bottom of the first column on the first page (left).

In case of a footnote with an email address (\thanks) and a superscript for an affiliation (x), the non-numeric character of the \thanks command comes first and the affiliation superscript second, normally separated by a superscripted comma, like in the following example:

```
D.-Eta\thanks{d.eta@pi.com}\textsuperscript{, 1}
```

Any other footnote in the body of the paper should use the normal numeric sequencing (i.e., ¹, ², ³, ...) and appear at the bottom of the same column in which it is used. Care should be taken to distinguish between supplementary notes on the topic and references to a source or an URL. The second ones have to appear in the reference section using a »\cite« command.

Acronyms

Acronyms should be defined the first time they appear, both in the abstract and in the rest of the paper.

References

A few guidelines related to the writing of references are summarized here. The numbering of references is used by citing one reference for each number. Each reference in a reference list should be a separate number entry. It is not allowed to use one reference number to group together different references (no compound references). All bibliographical and web references should be listed in a section called **REFERENCES**. This could be done using the old »thebibliography« environment where all reference entries are manually formatted:

```
\begin{thebibliography}{xx} % x:<10 xx:>=10 Refs
  \bibitem{bibId}
  :
\end{thebibliography}
```

However, the preferred solution is to use the »biblatex« package and »Biber« as the processing engine. Biber is used to process and format bibliographies, offering a more powerful and modern alternative to the older BibT_EX. It handles tasks like sorting, name handling, and automatic citation formatting, and provides comprehensive support for Unicode characters.

```
\documentclass[...
    biblatex, % biblatex is used
    ...,
]{jcow}

:
\addbibresource{\jobname.bib}
\addbibresource{additional-resources.bib}
:
\printbibliography
```

The name of the basic bibliography file should have the same name as the L^AT_EX file but it is possible to load more than one ».bib« file.

When citing a reference in the text, place the corresponding citation key »bibId« in a »~\cite{« command which should be placed close to point where the information is referenced. Please use an unbreakable space (»~«) to prevent the number ending up on the next column or page. Reference numbers belong inside the sentence (not after the closing period). In instances where phrases such as »(as shown) in/ see/ at [x]« are used, it is advisable to precede the cite key with a “Ref.” Accordingly, the sentence reads as follows: »(as shown) in/ see/ at Ref.~[x]«.

The reference citations in the text should be numbered in ascending order. Multiple citations should appear in the same bracket [3, 4], if there are ranges, these should be expressed as [1–4, 9]. This can be achieved by using only one »\cite{« command with a number of

»bibIds« separated by a comma. The sequential order of citation numbers must be done manually when using the «thebibliography» environment. When using the »biblatex« package, Biber ensures the correct sorting.

The »bibIds« in a \cite{} command do not have to be sorted, this will be done by Bib/L^AT_EX.

Hyperlinks Hyperlinks are essential for navigating the internet and have become an important part of scientific papers. Apart from the email link for the corresponding author on the title page, hyperlinks in JACoW papers may only appear in the reference section.

Hyperlinks in the reference section consist mainly of URLs of online sources (<https://>) and Digital Object Identifier (DOI), which are explained in the next subsection. Only the DOIs have an active link in the final PDF because in contrast to the standard »https://« links which might obsolete anytime, DOIs are designed to be permanent, they are a type of persistent identifier.

The font for typesetting links in L^AT_EX using the ‘url’ package is a monospaced (typewriter) font. To get a better distinction between »0« and »θ« the default font has been switched to »newtxtt«.

DOIs A »Digital Object Identifier« (DOI) should be included as part of a reference. The standard format of these identifiers are »doi:10.xxx/yyyy«.

For referencing a paper from JACoW, the DOI has the following format:

```
\doi{10.18429/JACoW-<conf_Id>-<paper_Id>}
```

The part ‘conf_Id’ consists of the conference acronym with a 4-digit year (e. g., IPAC2026), the part ‘paper_Id’ is the given identifier of the paper. A valid DOI for the before mentioned conference might look like

```
doi:10.18429/JACoW-IPAC2026-TH1AS2
```

In contrast to the functionality of the »\url« command, the »\doi{10.xxx/yyyy}« command places a link to »https://doi.org/10.xxx/yyyy« in the PDF. This active link redirects to the landing page of the publisher.

DOIs for JACoW conferences are currently available for all conferences since 2015, and IPAC2014. This list will be updated when older conferences are reprocessed with registered DOIs.

Citations For authors to properly cite the resources used when researching their papers is an obligation. In the interest of promoting uniformity and complete citations, the IEEE Editorial Style for Transactions and Journals (ieeetran), which itself adheres to the Chicago Manual of Style, has been adopted [6]. Please consult the appended material in **APPENDIX B** for details.

Periodicals When citing a periodical, the official abbreviation of the journal, as mandated by the ISO 4 [7] standard, should be used. The ‘University of British Columbia’ has a

website offering an interactive form for »Science and Engineering Journal Abbreviations« [8]. Some frequently used journals are listed in **APPENDIX C**.

Authors must pay close attention to the details of the style to ensure complete, accurate, and properly formatted references.

TEMPLATE

The JACoW L^AT_EX Template is available as PDF and TeX file under the name »jacow_latex_template« from the JACoW website [9] and CTAN [10].

The package consists of the template file to be used as a starting point for your own paper and the style guide (this document), which describes the use and set of standards for writing and formatting that ensures consistency over all JACoW papers.

CHECKLIST FOR ELECTRONIC PUBLICATION

Authors are requested to go over the following checklist for electronic publication:

- Figures should use fonts with 6 pt minimum, PDF file must have their fonts embedded.
- Check that citations to references appear in sequential order and that all references are cited.
- Check that References are complete, with DOIs appended where existing, and formatted in the correct style as detailed in **APPENDIX B**.
- Check that the PDF file prints correctly.
- Switch on the boxit option and check that no material sticks out into the margin.

CONCLUSION

Any conclusions should be in a separate section directly preceding the **ACKNOWLEDGEMENTS**, **APPENDIX**, or **REFERENCES** sections, in that order.

ACKNOWLEDGEMENTS

The JACoW template has encompassed several renewed undertakings as advances in the publishing field have been made. This template takes its basic form from that originally provided by Christine Jean-Petit-Genaz and John Poole of CERN.

APPENDIX

Any appendix should be in a separate section directly preceding the **REFERENCES** section. If there is no **REFERENCES** section, this should be the last section of the paper.

APPENDIX A: FORMATTING OF AUTHORS AND AFFILIATIONS

The names of authors, their organizations or affiliations may be grouped by author or by affiliation. The name of the submitting or primary author should be first, followed by the coauthors, alphabetically. If the author list spans multiple lines, please be sure to break the line in a manner that does not split the author's initials from the author's last name. This is easily done by placing unbreakable spaces between the initial(s) and last name. It has been established that there is no comma after the name of the author when the following line contains the affiliation.

In cases where authors have multiple affiliations, the secondary affiliation is inserted below the author/primary af-

filiation listing, and indicated by a superscript number, as shown in the following. Only the minimal form of the institute name and location (city, country) is required. Post or ZIP codes should be omitted.

Footnotes on the title and author lines may be used for Acknowledgements and email addresses. For manuscripts submitted by large collaborations with potentially many tens of authors and where, additionally, there may be page number limitations, a format consisting of the principal author's name and institute, followed by "on behalf of the ... collaboration", is preferred.

Grouped by Author

The author/affiliation listing is formatted in the following way:

A. Alpha, CERN, Geneva, Switzerland

If there are multiple affiliations, the affiliation is indicated with a superscript as follows:

A. Alpha^{1,2}, B. Beta³, C. Gamma⁴, D. Delta⁵

¹ CERN, Geneva, Switzerland

² Cambridge University, Cambridge, UK

³ Deutsches Elektronen-Synchrotron DESY, Zeuthen, Germany

⁴ SLAC National Accelerator Laboratory, Menlo Park, CA, USA

⁵ RIKEN Nishina Center, Wako, Saitama, Japan

Grouped by Affiliation

Collaborations with many affiliations may have a preference to list the authors by affiliation. Here, the author and affiliation listing should be centered. In cases where authors have multiple affiliations, the secondary affiliation is inserted below the author/affiliation listing and is indicated with a superscript.

A. Alpha¹, CERN, Geneva, Switzerland

B. Beta, Deutsches Elektronen-Synchrotron DESY, Zeuthen, Germany

C. Gamma, SLAC National Accelerator Laboratory, Menlo Park, CA, USA

D. Delta, RIKEN Nishina Center, Wako, Saitama, Japan

¹ also at Cambridge University, Cambridge, UK

For manuscripts submitted by large collaborations with many tens of authors, a format consisting of the principal author's name and institute, followed by "on behalf of the ... collaboration", is preferred. If, on the other hand, all author names are to be explicitly included, the author is reminded that each of these must be entered into Indico through the web portal to ensure the cross-referencing of authors to papers in the final proceedings.

A. Alpha, CERN, Geneva, Switzerland
on behalf of the MICE collaboration

APPENDIX B: REFERENCE STYLE GUIDE AS APPLIED TO JACoW PAPERS, PERIODICALS AND OTHER WORKS

Formatting of Authors and Paper Titles

The formatting of authors and paper titles is common to both proceedings' volumes and journals and are outlined in the following.

Author Listing Careful attention should be given to the placing of commas and the use of 'and' in the author list. For the case of three or more authors (as in Ref. [3]), a comma also follows the penultimate author. The preference for *et al.* takes precedence when the number of authors is greater than six. See Table 2 for a synopsis.

Table 2: Formatting Authors

No. of Authors	Format
1	A. T. Alpha,
2	A. T. Alpha and B. Beta,
3 to 6	A. T. Alpha, B. Beta, and J.-P. Gamma,
>6	A. T. Alpha <i>et al.</i> ,
>6 but with two primary authors	A. T. Alpha, B. Beta, <i>et al.</i> ,

Paper Title As is modern practice in references, the title of the paper is written in sentence case, i.e., only the initial letter of the first word in the title is capitalized. Proper nouns, however, also have a capital. Capital letters appearing in acronyms likewise remain unaltered.

Conference Proceedings

The format for published JACoW proceedings papers is detailed in the following and can also be readily deduced from Refs. [1-5]. Use of the said style for references ensures a proper import into digital libraries and information sources such as INSPIRE, Scopus, and Google Scholar. Authors are also reminded to make a distinction between papers published in JACoW proceedings, which have page numbers and, in the case of recent publications, digital object identifiers (DOIs), and those papers that may have been presented at past JACoW conferences but were not published [6]. References to contributions presented at the same conference should be written as shown in Ref. [7].

Conference Title The title of the proceedings is written in title case in italics using standard abbreviations, such as *Int.* and *Conf.* The preposition, "in", in normal font, precedes the proceedings title. The abbreviated form of the conference is sufficient, e.g., in *Proc. IPAC'24*. If the complete name of the conference is preferred to avoid possible ambiguities, then ISO 4 abbreviations may be applied, e.g., in *Proc. 13th Int. Comput. Accel. Phys. Conf. (ICAP'18)*.

Conference Location and Month, Year The location, i.e., city, state (if applicable), and country of the conference

venue, the month (three-letter abbreviation) and the year the conference took place, is then listed.

Page Numbers and DOI Finally, details pertaining to the paper itself, such as mandatory page numbers, and the DOI, if existing, are listed in the given order. A monospaced font for the DOI is used to help distinguish it from normal text. The font for typesetting links in L^AT_EX using the 'url' package is a monospaced (typewriter) font. To get a better distinction between »0« and »0« the default font has been switched to »newtxtt«. The conference paper ID may be included in the absence of a DOI to facilitate a search through internet search engines. DOIs have been assigned to all JACoW publications since 2015, and IPAC2014. This list will be updated when older conferences are reprocessed with registered DOIs. The use of DOIs is strongly mandated, and an active hyperlink in the final PDF because in contrast to the standard »https://« links which might obsolete anytime, DOIs are designed to be permanent, they are a type of persistent identifier.

Use of the said style for references ensures a proper import into digital libraries and information sources such as INSPIRE, Scopus, and Google Scholar. Authors are also reminded to make a distinction between papers published in JACoW proceedings (which have page numbers and, in recent publications, DOIs) and those papers that may have been presented at past JACoW conferences but were not published [6]. References to contributions presented at the same conference should be written as shown in Ref. [7]; the wording "this conference" may be appended.

Referencing Periodicals

When referencing periodicals, special attention should be given to including all the necessary details: author names, paper title, journal, volume, page/article number, and year. The DOI should be included if available. These details should be formatted according to the style shown in Refs. [8-12]. Journal abbreviations follow the ISO 4 standard. References [13, 14] are good sources for journal abbreviations. A set of selected journal abbreviations is listed in **APPENDIX C**.

Referencing Other Sources

The IEEE style is also shown for papers that have been accepted or submitted for publication in periodicals [15, 16], arXiv preprints [17], online sources [18-20], books [21, 22], internal and technical reports [23-27], theses [28], handbooks and (reference) manuals [29-31], patents [32] and unpublished material [33, 34].

Alignment of References

Entries to the **REFERENCES** section follow a hanging indent structure. In case of manual formatting of references, the value of 'x' in the corresponding thebibliography

command must be large enough to reserve sufficient space for the digits.

```
% Use for 10-99 references
\begin{thebibliography}{99}
% Use for 1-9 references
\begin{thebibliography}{9}
```

This is automatically taken care of when using Bib $\LaTeX$.

Paper Published in a Conference Proceedings

The title of the paper is written in sentence case. References are typeset in 9 pt size. The font for typesetting links in $\LaTeX$ using the ‘url’ package is a mono-spaced (typewriter) font for DOIs (`\doi{}`) and URLs (`\url{}`). To get a better distinction between »0« and »0« the default font has been switched to »newtxtt«.

The DOI should be confined to within a single line rather than being split in arbitrary positions across multiple lines. This is achieved using the command `\doi{}`, which measures the remaining space on the current line and inserts a line break if the DOI does not fit. In contrast to the functionality of the »\url{« command, the »\doi{10.xxx/yyyy}« command places an active link to »https://doi.org/10.xxx/yyyy« in the PDF. This link redirects to the landing page of the publisher.

- [5] A. Alpha, B. T. Beta, *et al.*, “Status of Cyclotrons around the world”, in *Proc. Cyclotrons’22*, Beijing, China Dec. 2022, pp. 57-59. doi:10.18429/JACoW-CYCLOTRONS2022-PAPERID

Unpublished Paper from a Previous Conference

The conference name is given in normal font. The paper ID may be given if material supplementing the proceedings exists on the JACoW website, e.g., PDF of talk.

- [6] A. Alpha, “An interesting talk but paper not submitted”, presented at IPAC’14, Dresden, Germany, Jun. 2014, paper MOP057, unpublished.

Paper Presented at the Current Conference

For papers at the current conference the conference name is given in normal upright font preceded by ‘presented at’:

- [7] A. Alpha and B. T. Beta, “Title of talk or poster presented at this conference”, presented at IPAC’25, Taipei, Taiwan, Jun. 2025, paper MOAB01, this conference.

Published in a Periodical

If journals are paginated by volume, the issue number is optional. The month of publication is optional.

- [8] A. Alpha *et al.*, “Title of paper published in journal”, *Phys. Rev. Lett.*, vol. 114, no. 5, p. 050511, Feb. 2014. doi:10.1103/PhysRevLett.114.050511
